

Testing task for Automation Engineer

(Selenium / WebDriver)

TESTS TO DEVELOP:

1. Test #1. Open Google. Search for “automation”. Open the first link on search results page. Verify that title contains searched word
2. Test #2. Open Google. Search for “automation”. Verify that there is expected domain (“**testautomationday.com**”) on search results pages (page: 1-5).

REQUIREMENTS AND RECOMMENDATIONS:

- Any xUnit or related framework could be used
- Page object pattern should be used or any other approach that simplify maintenance
- Dependency resolution could be done inside project (NuGet, maven or any other)
- Parametrization is a plus (domain, browser, resolution, etc) configured in external configuration file or/and through Maven launch
- Plus if logger is added
- Plus if parallelization is implemented

DELIVERABLES:

Zipped “src” folder or link (and shared read permissions) to git resource.
